"Digging Up the Value Chain: Mineral Export Restrictions and Industrial Upgrading" [SSRN]

Abstract: Resource-rich developing countries increasingly restrict raw mineral exports to promote industrial upgrading. I develop a general equilibrium framework in which mineral export restrictions improve the terms of trade and subsidize downstream manufacturing, but their welfare gains depend on whether downstream expansion reaches stages with strong scale externalities. Using a global dataset of 112 mineral export restrictions imposed by 28 countries during 2008–2023, I trace their effects along downstream production chains. I find that restrictions reduce targeted mineral exports by 42 percent while raising their export prices by 14 percent. Downstream exports increase by 12 percent, but the gains are concentrated in the first processing stage, in base metals, and in technologically simple products. These findings reveal a policy dilemma: upstream export restrictions promote basic processing but have limited reach into more advanced manufacturing, where the potential gains from industrial upgrading may be greater.
